PORTFOLIO VALUATION & INVESTMENT PERFORMANCE ANALYTICS

Illustrative portfolio report | 20 fictional investments | Reporting date: 31 December 2026

Executive overview

This report summarises the synthetic investment portfolio contained in the accompanying Excel workbook. It combines public and private holdings, a DCF and trading-multiple valuation framework, sector exposure, unrealised value creation and interim cash distributions. All results below are workbook-reported illustrative values, not independently audited fair values.

Portfolio indicator	Illustrative value
Invested capital	$322.35m
Portfolio NAV / current fair value	$754.13m
Interim distributions	$21.05m
Total value (NAV + distributions)	$775.18m
Unrealised gain	$431.78m
Total value / invested capital	2.40x
Simple total return	140.48%

Portfolio composition

The workbook covers 20 fictional investments across technology, financials, healthcare, industrials, energy, consumer, utilities and infrastructure. Based on modelled fair values, private holdings represent $557.91m (74.0%) and public holdings $196.22m (26.0%).

Sector allocation by fair value

Sector	Fair value ($m)	Portfolio weight
Technology	153.88	20.4%
Healthcare	153.64	20.4%
Financials	136.08	18.0%
Industrials	133.74	17.7%
Infrastructure	64.98	8.6%

Sector	Fair value ($m)	Portfolio weight
Consumer	54.36	7.2%
Energy	45.84	6.1%
Utilities	11.62	1.5%

VALUATION METHODOLOGY & ANALYTICAL REVIEW

Valuation architecture

The model includes investment-level financial inputs, projected free cash flows, DCF valuations, enterprise-to-equity value bridges, EV/EBITDA reference multiples and consolidated portfolio fair values. Portfolio attribution aggregates unrealised gains and cash distributions; sensitivity schedules illustrate valuation changes under alternative assumptions.

Performance interpretation

The reported 2.40x multiple is calculated as (current NAV + interim distributions) / invested capital. The reported 140.48% total return is the corresponding cumulative gain on cost. Neither measure is a dated-cash-flow IRR. The dashboard also displays an indicative annualised return; it should not be interpreted as a verified money-weighted IRR without dated contributions, distributions and terminal values.

Reconciliation and limitations

Reconciliation	Illustrative result
NAV + distributions	$754.13m + $21.05m = $775.18m
Unrealised gain	NAV $754.13m - cost $322.35m = $431.78m
Value multiple	$775.18m / $322.35m = 2.40x
Portfolio return	($775.18m / $322.35m) - 1 = 140.48%

Key modelling qualifications

The portfolio is fictional and the valuation inputs are stylised. The model is suitable as a financial modelling demonstration, not an investment recommendation or a formal fair value opinion. Valuation assumptions, especially terminal growth, discount rates, multiples and ownership-level adjustments, require asset-specific calibration for actual investment use.

Some public holdings are assessed within the same broad valuation architecture as private investments. In a real portfolio, quoted prices in active markets and applicable fair value standards may take precedence over internally modelled values. The portfolio NAV here is an illustrative aggregate of holding fair values, not an audited fund NAV.

Suggested further enhancements

For institutional-grade reporting, add dated investment cash flows and XIRR, documented valuation calibration, valuation hierarchy, currency treatment, portfolio-level fee and liability adjustments, and formula-based reconciliation controls.

Disclaimer

All companies, transactions, figures, valuations and assumptions are synthetic. No content represents an actual investment portfolio, investor result or expected future performance. This report is for educational and professional portfolio demonstration only and is not investment advice.
